

AI services specialized in the maritime industry

# “AI-BANTO”

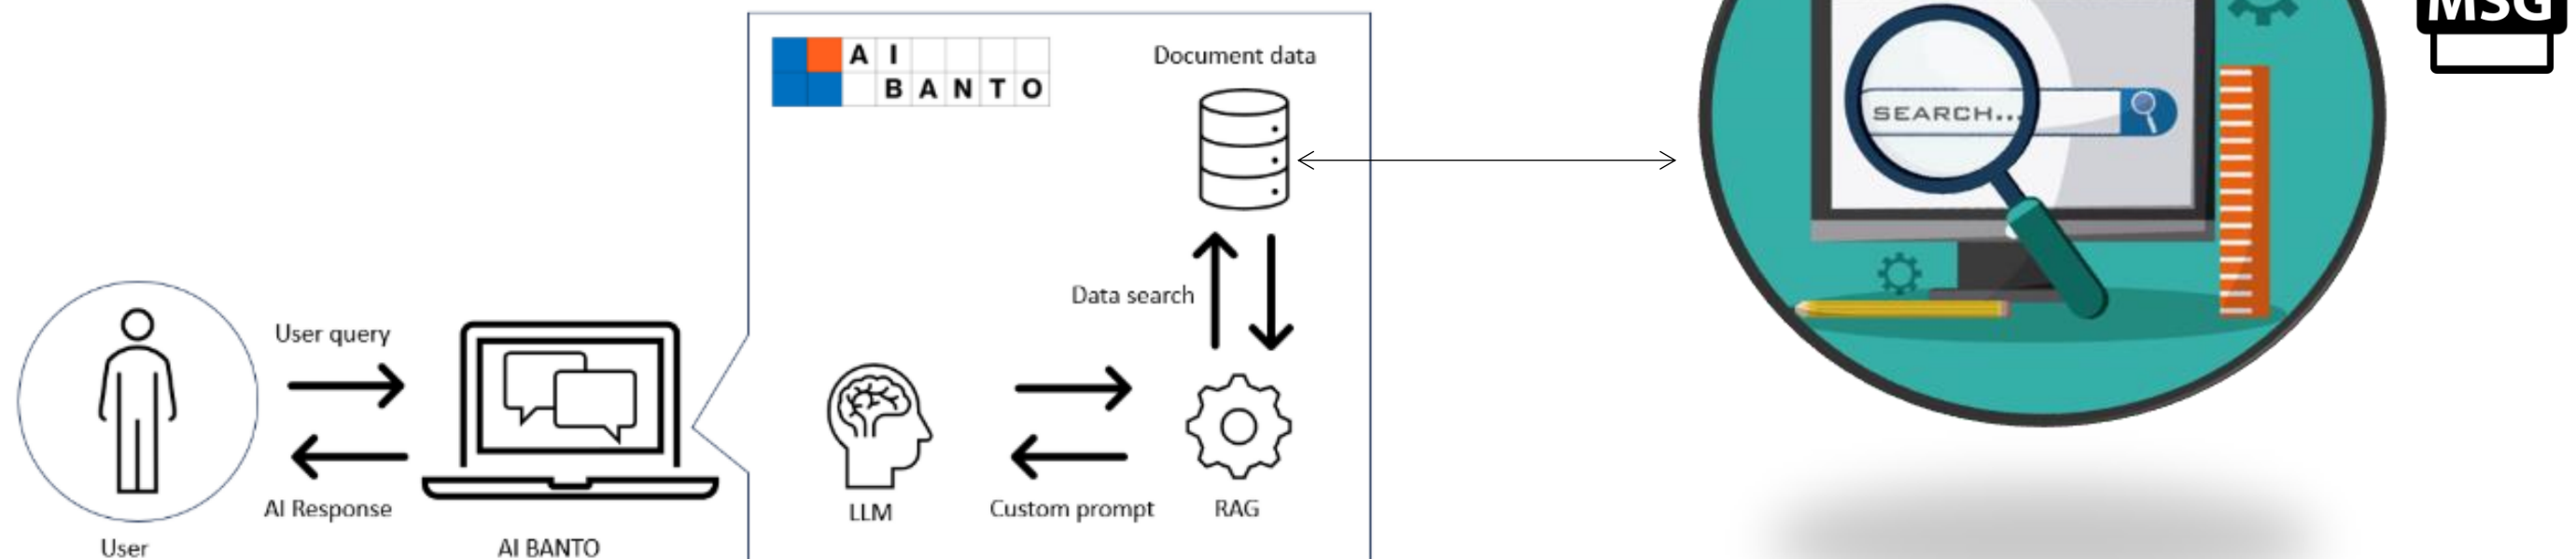

# What is "AI-BANTO" ?

This is a service developed specifically for maritime operators to be used in shipping operations.

1. Through AI chat, we provide "**document search**," "**summarization**," and "**translation**" in a conversational manner.
2. Documents and contracts **can be easily stored as** the user's dedicated data.
3. Based on the stored data, **AI will respond to queries regarding necessary information** and contract details in a chat format.

\*The data formats that can be stored include PDF, Excel, Word, msg, etc.

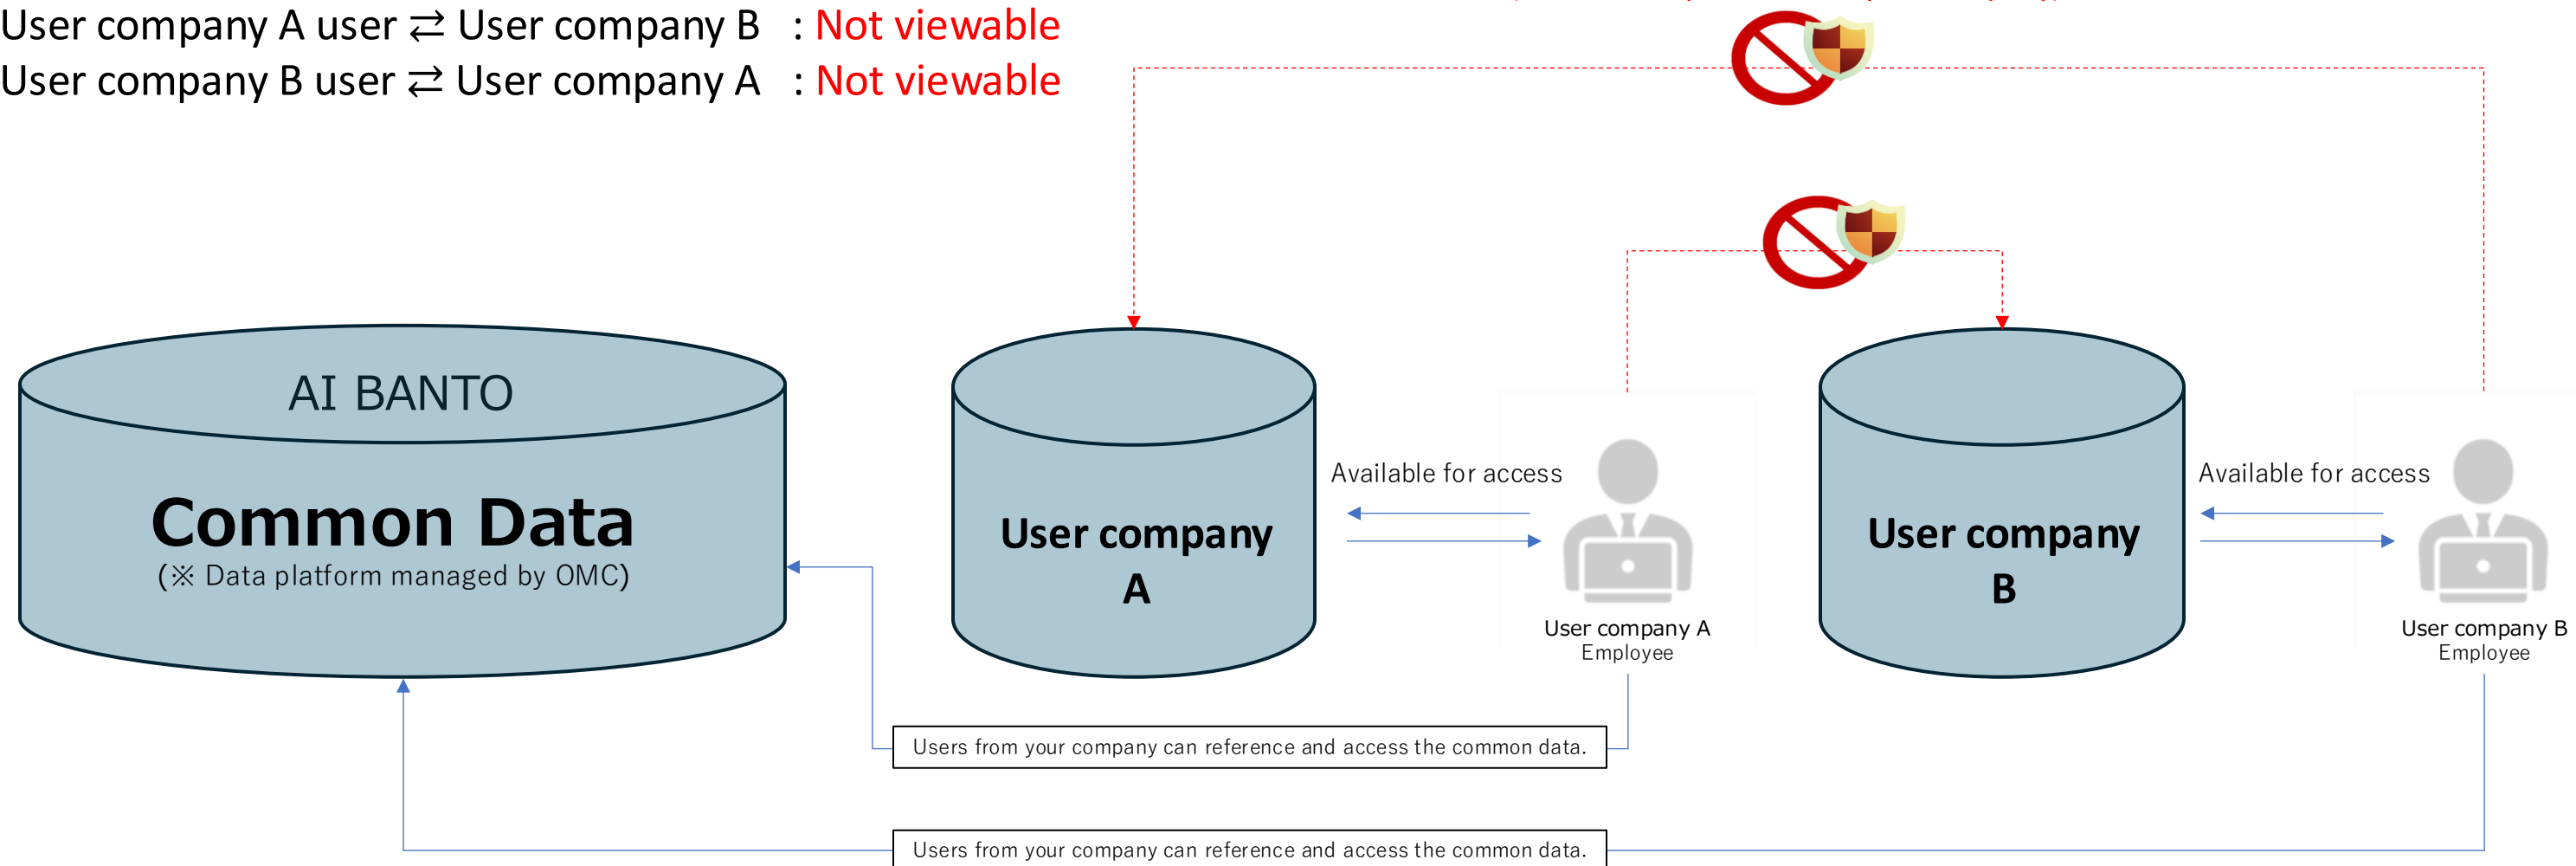

## Key Point

Your company's data is designed and operated in such a way that only your company has access to it. Therefore, no one else can view it.

Common data ⇔ All user companies : **Available for reference**  
 User company A user → Common data : **Available for viewing**  
 User company A user ⇔ User company B : **Not viewable**  
 User company B user ⇔ User company A : **Not viewable**

※Access from other companies is strictly prohibited.  
 (Access is only available to your company)

Only the "common data" managed by our company can be accessed for reference by all participating companies. However, access is restricted to each company's own account. Therefore, neither our company nor any other company can "view" or "access" data from other companies, as the system is designed to prevent this.

1. The complexity of information retrieval due to a **shortage of skilled personnel**.

2. Management and **transfer of knowledge**.

3. Handling **complex operations**.

# Problem-solving through “AI BANTO”

## 1) Standardization of operations

“AI BANTO” standardizes operations that have traditionally been carried out in a highly personalized manner over many years. Regardless of whether the person is highly experienced or less experienced, by using “AI BANTO”, it becomes possible to bridge the experience gap, from knowledge and terminology to methods and procedures.

## 2) Centralization of knowledge and information

Please store all necessary data in “AI BANTO”.

The stored data and information will be fully utilized, and when users ask questions via chat, “AI BANTO” will respond as the user's "brain," based on the stored data.

## 3) Accessing a wide range of information simultaneously by simply making inquiries in a chat format.

By simply asking questions in the chat about what you want to know or confirm, you can obtain the necessary information for complex tasks. This eliminates the need for "asking," "confirming," and "researching," thereby streamlining the workflow and improving efficiency.
